AUTOMATIC CHANNEL SWITCHING

Abstract of the Disclosure

5 A system allows a user to select prompts during the
viewing of video transmission on a first channel about
events that may have occurred in the course of a transmis-
sion on a second channel. The user may be provided with a
mechanism, such as a remote control, that allows the user
to switch to the second channel after receiving the prompt
on the first channel. Since the second channel is continu-
ously recorded, the user can switch to the second channel
10 to view a recorded portion of the transmission on the
second channel up to the event on the second channel, to
enable the user to decide whether to switch to view the
second channel.
